Appendix . Specification of Time Domain Measures

Suppose there are N successive interbeat intervals denoted RR $_1$, RR $_2$,, RR $_N$ recorded over an epoch of duration T_{Epoch} .

$$T_{Epoch} = \sum_{i=1}^{N} RR_{i}$$

In this notation, and in the absence of removing outlying values of RR, the five time domain measures are:

Mean RR interval (Denoted in Kubios by "Mean RR")

$$RR_{Mean} = \frac{1}{N} \sum_{i=1}^{N} RR_{i}$$

Typical units are milliseconds.

Standard deviation of RR intervals (Denoted in Kubios by" STD RR (SDNN)")

SDNN =
$$\left\{ \frac{1}{N-1} \sum_{i=1}^{N} (RR_i - RR_{Mean})^2 \right\}^{1/2}$$

Typically reported in units of milliseconds.

Mean heart rate (Denoted in Kubios by "Mean HR")

$$\overline{HR} = \frac{1}{N} \sum_{i=1}^{N} 1 / RR_{i}$$

A change of units is required. Interbeat intervals are typically reported in milliseconds and mean heart rate is typically reported in \min^{-1} .

Standard deviation of heart rate (Denoted in Kubios by "STD HR")

STDHR =
$$\left\{ \frac{1}{N-1} \sum_{i=1}^{N} (1/RR_i - \overline{HR})^2 \right\}^{1/2}$$

Typically reported in units of min⁻¹

Root mean square of successive differences (Denoted by "RMSSD" in Kubios documentation)

Given N RR intervals, define N-1 successive differences

Supplement HRV in longitudinal psychiatric assessment 2021-04-11-A

$$\begin{aligned} D_1 &= D_2 - D_1 \\ D_2 &= D_3 - D_2 \\ D_3 &= D_4 - D_3 \\ &\vdots \\ D_{N-1} &= D_N - D_{N-1} \end{aligned}$$

The root mean square of successive differences is given by:

$$RMSSD = \left\{ \frac{1}{N-1} \sum_{i=1}^{N-1} D_i^2 \right\}^{1/2}$$

It is reported in units of milliseconds.

Determination of the Minimal Clinically Important Difference using a Global Rating Scale as a clinical anchor

- A. A measure of heart rate variability is obtained before and after treatment.
- B. A GRS assessment is obtained from each patient after treatment to determine the patient's perception of clinical change. A commonly used GRS is a 15-point scale where -7="Much Worse", 0="No Change" and +7="Much Better".
- C. Declare a 3-point change on the GRS ("Somewhat Better" or "Somewhat Worse") to be the minimal clinically important difference.
- D. Use the 3-point change criterion to identify the subset of "minimal changers" within the patient population and determine the change in the HRV measure for each minimal changer.
- E. The Minimal Clinically Important Difference is the average change (absolute value) observed in the minimal changer subpopulation.

Setting the minimal change criterion to three points on the GRS is a matter of clinical judgment. If the change criterion is increased, for example to five ("Quite a Bit Better" and "Quite a Bit Worse"), the Minimal Clinically Important Difference will increase. In addition to the Global Rating Scale, which is an subjective anchor, possible objective anchors include medication use and health care system utilization. Variants of anchor-based methods include within-patient score change, between-patients score change, sensitivity and specificity-based designs and social comparison designs [29].

Figure 1. SDNN

Figure 1. Standard Deviation of RR values (SDNN): (a) When aggregating data across both sessions, there was a main effect of segment, indicating a general decrease in SDNN from initial rest, in response to the stressor, followed by a general increase during the recovery portion of the paradigm and then a slight decrease in SDNN during the standing segment (F=26.02, p<.001); (b) There appeared to be a main effect of device, such that HM_{PC} tended to display greater SDNN values compared to all other devices (F=9.32, p<.001), with post-hoc analyses revealing higher SDNN value at standing for the HM_{PC} device compared to the EPA6 device; and (c) when examining the interaction between device and segment all 4 devices tended to vary in a similar pattern throughout the session (F=0.75, P=.70). Data from a linear mixed model with two fixed factors (device, segment) and a random subject effect to calculate the difference between devices and between sessions.

Figure 2. RMSSD

Figure 2. Root mean square of successive differences values (RMSSD): (a) When aggregating data across both sessions, there was a main effect of segment, indicating a general decrease in RMSSD from initial rest, in response to the stressor, followed by a general increase during the recovery portion of the paradigm and then a slight decrease in RMSSD during the standing segment (F=2.97, p=.02); (b) There appeared to be a main effect of device, such that HM_{PC} tended to display greater RMSSD values compared to all other devices (F=41.76, p<.001), with post-hoc analyses revealing higher RMSSD value at each time segment for the HM_{PC} device compared to EPA6; and (c) when examining the interaction between device and segment all 4 devices tended to vary in a similar pattern throughout the session (F=1.00, p=.45). Data from a linear mixed model with two fixed factors (device, segment) and a random subject effect to calculate the difference between devices and between sessions.

Figure 3. STD HR

Figure 3. Standard deviation of instantaneous heart values (STD HR): (a) When aggregating data across both sessions, there was a main effect of segment, indicating a general increase in STD HR from initial rest, in response to the stressor, followed by a general decrease during the recovery portion of the paradigm and then a slight decrease in STD HR during the standing segment (F=19.62, p<.001); (b) There appeared to be a main effect of device, such that HM_{PC} tended to display greater STD HR values compared to all other devices (F=8.48, p<.001), with post-hoc analyses revealing higher STD HR value at standing for the HM_{PC} device compared to EPA6; and (c) when examining the interaction between device and segment all 4 devices tended to vary in a similar pattern throughout the session (F=.53, p=.90). Data from a linear mixed model with two fixed factors (device, segment) and a random subject effect to calculate the difference between devices and between sessions.

Figure 4. Mean HR

Figure 4. Mean heart rate values (Mean HR): (a) When aggregating data across both sessions, there was a main effect of segment, indicating a general increase in Mean HR from initial rest, in response to the stressor, followed by a general decrease during the recovery portion of the paradigm and then a slight increase in Mean HR during the standing segment (F=62.04, p<.001); (b) There appeared to be a main effect of device, such that HM_{HH} tended to display lower Mean HR values compared to the EPA6 device (F=3.32, p=.02); and (c) when examining the interaction between device and segment all 4 devices tended to vary in a similar pattern throughout the session (F=1.32, p=.20). Data from a linear mixed model with two fixed factors (device, segment) and a random subject effect to calculate the difference between devices and between sessions.

Figure 5. Low frequency to high frequency ratio values (LF/HF): (a) When aggregating data across both sessions, there was a main effect of segment, indicating a general increase in LF/HF from the stressor to the paced breathing portion of the paradigm and then a slight decrease in LF/HF during the standing segment (F=17.64, p<.001); (b) There appeared to be a main effect of device, such that HM_{PC} tended to display lower LF/HF values compared to all other devices (F=10.65, p<.001) with post-hoc analyses revealing that at standing, HM_{PC} displayed lower LF/HF compared to EPA6; and (c) when examining the interaction between device and segment all 4 devices tended to vary in a similar pattern throughout the session (F=1.01, p=.44). Data from a linear mixed model with two fixed factors (device, segment) and a random subject effect to calculate the difference between devices and between sessions.

Table 1. Operational reliability of the four devices

Device Operational Reliability expressed numerically as probability of successful operations (p_s) and probability of operational failures (p_f) based upon observed recordings of 140 time segments. ($p_s + p_f = 1$)

Device	Successful	Probability of	Probability of
	Operations	success	failure
EPA6	140/140	1.0000	0.0000
BioPatch	140/140	1.0000	0.0000
HM_{PC}	113/140	0.8071	0.1929
$\mathrm{HM}_{\mathrm{HH}}$	125/140	0.8929	0.1071

Table 2. Numerical Values of Heart Rate Variability Measures

Mean numerical values of six measures of heart rate variability in five conditions (Rest 1, Stressor, Rest 2, Paced Breathing, Standing) for each of four devices (EPA6, BioPatch, HM_{PC}, HM_{HH}). The numerical results present the mean values and the standard deviations of those means. The six measures are: mean RR interval (RR_{Mean}), standard deviation of RR intervals (SDNN), mean heart rate (HR_{Mean}), standard deviation of heart rate (STD HR), root mean square of successive differences (RMSSD) and the ratio of low frequency to high frequency spectral power (LF/HF Power), HF power, LF power (mean±standard deviation)

Table 4. Intraclass correlation coefficients

Intraclass correlation coefficients (ICC (2,1), Shrout and Fleiss, 1979) for six measures of heart rate variability (Mean RR, SDNN, Mean HR, STD HR, RMSSD, LF/HF Power), in five conditions (Rest 1, Stressor, Rest 2, Paced Breathing, Standing), for each of four devices (EPA6, BioPatch, HM_{PC}, HM_{HH}). Numerical results report the intraclass correlation coefficient, and the corresponding 95% confidence intervals.

Table 6. Bland-Altman Limits of Agreement

Limits of Agreement and 95% Confidence Intervals of five measures of heart rate variability (Mean RR, SDNN, Mean HR, STD HR, RMSSD, LF/HF Power), in five conditions (Rest 1, Stressor, Rest 2, Paced Breathing, Standing), comparing three devices (BioPatch, HM_{PC}, HM_{HH}) against the EPA6. Numerical results are: (1.) mean value of the inter-device difference and the standard deviation of that mean, (2.) the lower limit of agreement and the confidence interval of that limit of agreement, (3.) the upper limit of agreement and the confidence interval of that limit of agreement.

Device Device Segment Measure (SID) (95%CI) (95%CI)		- · ·	~		Mean Difference	Lower Limit of Agreement	Upper Limit of Agreement
